

Some useful git commands

Setting Up Git

```
git config --global user.name "Alfredo Linguini"
git config --global user.email "a.lingui@ratatouille.fr"
git config --global core.autocrlf input    # (Mac & Linux)
git config --global core.autocrlf true    # (For Windows)
git config --global core.editor "nano -w"
git config --global init.defaultBranch main
```

Helpful Extras

```
git help          Get help on commands
.gitignore        List of files and directories not to track
```

More File Operations

```
git rm            Remove a file in the repository
git mv            Move or rename a file within the repository
```

Creating A Repository

```
git init          Create a repository in the current directory
```

Local Workflow

```
git status        Are there pending changes?
git add [file]     Add changed files to staging area
git commit -m      All single characters matching the pattern
[message]
git log            Show the history of changes
                  --oneline    Concise history of changes
git diff           What has changed between commits?
git switch         Change to a different branch
git switch -c X    Create and switch to a branch named X
```

Time Travel

```
git show          Show what changed in a commit
git restore -s (Specific commit) Restore to a previous state
HEAD              The most recent commit
HEAD~2            Two commits prior to HEAD
[tag]             A named (tagged) commit
```

Remotes

```
git clone          Make a local copy of a remote
git remote add     Define or check remotes
-v
git push           Push local changes to remote
                  -u origin [branch] Push new local branch
git pull           Pull remote changes to local
```
